WHAT I TAKE ON

Infrastructure Cost Audit

40% Reduction

Cut cloud spend 40% by automating VM lifecycle and rightsizing compute on GCP. Most GCP bills carry waste nobody's looked at closely, this finds it and fixes it.

High Load Architecture Review

80K+ RPS

Built and operated systems sustaining 80K+ RPS in production. I stress-test your architecture before your users do.

Platform Reliability Setup

97% Uptime

Maintained 97% uptime across production services with k6 and Grafana observability. That's the bar your stack gets held to.

RECENT WORK

Showcase: Runnable proof of how I build: concurrency patterns in Go, a full observability stack, GCP infra modules, Kubernetes manifests, an AI/RAG pipeline. Clone any piece and run it in minutes, no proprietary code involved.

Avoid AI: Strips AI-writing tells out of every response automatically, no config, no commands. Builds a personal voice profile so output sounds like you instead of a template.
